Yami Privacy Policy

Effective November 6, 2026

Information used to provide Yami

Yami processes your guest account identifier, profile details, selected sports, posts, uploaded photos or videos, comments, follows, club memberships, challenge progress, check-ins, reports and blocks. It stores private messages and delivery/read information for communication between mutual followers. You choose what to enter and upload.

The app keeps a device installation identifier and the saved sign-in session on your device. It also stores purchase transaction identifiers, product identifiers, wallet history and pending user actions needed to recover interrupted operations. Apple processes payment information; Yami does not receive your payment-card details.

Public content and private messages

Profile information and published media may be visible to other people. Public media links can also be opened outside the app. Private message attachments require authorized access. Private messaging is not described as end-to-end encrypted. Blocking or ending a mutual follow restricts further chat access, but cannot retract copies another person has already made.

Permissions and your choices

The system photo picker shares only media you select. Camera or microphone access requires a separate system permission when an available capture feature needs it. You can manage app permissions in iOS Settings. Notifications are optional; the app may register a device notification token. Notification delivery depends on the available service and device settings.

Yami does not request your contacts or precise device location. City and neighborhood information comes from content you provide. No third-party AI processing is included in this version.

Service providers and security

Supabase provides account, database, media-storage and messaging infrastructure. This project's primary hosting region is Singapore; service operations may involve processing in other locations under the provider's terms. Supabase's privacy information is available at https://supabase.com/privacy. Apple provides app distribution, purchases and device permissions: https://www.apple.com/legal/privacy/.

Access controls restrict private records, and network requests use encrypted connections. No system can guarantee absolute security. Operational logs and backups may retain information separately from active app records; we do not promise immediate deletion from every backup.

Access, correction and deletion

Edit Profile changes your profile, and Settings provides reporting, blocked-account controls and account deletion. Deletion removes the active account and associated app records; purchase evidence required to avoid duplicate delivery may remain on your device. Signing out of a guest account can make it impossible to regain access to that account. Avoid deleting the app until pending transactions are resolved.

This policy may change when data practices change. Planned support contact: support@yami.app; availability has not yet been confirmed. Use the implemented in-app controls to manage the data they cover.
